

GLOBAL CENTS | **Power Tools™** for Deployments version 2

Global Cents provides premium Enterprise Content Management (ECM) products, migration tools, and customization. We have the foremost expertise in providing Livelink® extensions, custom modules, and consulting for OScript, WebLingo, Livelink database, LAPI, DAPI, WAPI, and UAPI. Our extensions to Livelink modules are used by Fortune 1000 companies to reduce cost and expand user satisfaction in areas that include Livelink workflow, document management, and collaboration.

Paving the Way to Safe, Effective Livelink® Migration & Deployment

IT departments are currently faced with the daunting task of integrating and troubleshooting new modules and functionality in Livelink instances that are fully operational. This process usually includes moving the application from a development environment to the testing environment and then to the production environment. The current method for accommodating this migration usually entails countless hours recreating taxonomies and reconfiguring categories, forms, web reports, and workflow maps. The margin for error is considerable in this labor intensive procedure.

GCI Power Tools™ for Deployments (PTD) solves this problem by exporting the entire product object structure into a set of XML files, and then supports moving them into the new environment together with recreating the entire structure in the new Livelink instance. The references between all the imported objects, and the references to the system users, are all maintained after the import.

Circular Livelink Category dependencies are also maintained in PTD. If the category has not been created at the time an object that uses that category is created, the information is cached until the category is imported and re-linked. Forms and Form Templates can be exported and imported maintaining not only the template links, but also the view links. Form data and form data stored in tables can be exported across systems as well.

PTD also solves the problem of moving workflow maps from one system to another: workflow maps are updated to re-link all forms, categories, objects, and attachments. PTD also supports exporting user and group items created during development and recreates them on the new system, as well as remapping the user IDs (provided the names and domains are the same).

In addition to deployment management, PTD also facilitates testing and troubleshooting objects in Livelink that were heretofore unable to be separated for external analysis. Problem objects can now be exported by PTD and sent to specialized technical support where these object structures can be easily recreated and tested.

PTD is also ideal for merging and dividing Livelink instances. And because it supports audit and creation information, PTD is strategically aligned with Global Cents' content validation partner Valiance TRUCompare™ to provide complete, end to end migration & validation solutions for even the most demanding of regulatory environments.

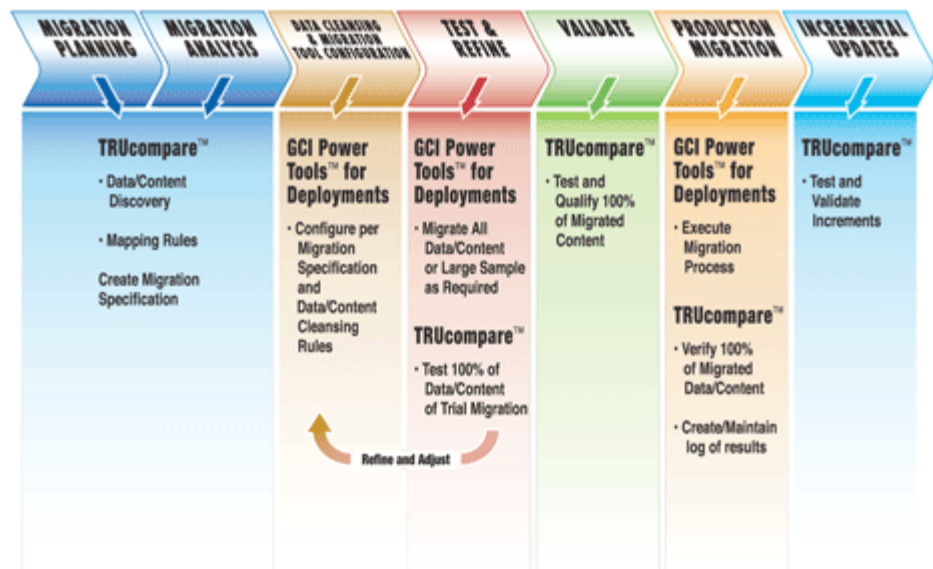

GCI Power Tools for Deployments Version 2.0 New Features

Version 2.0 of GCI Power Tools™ for Deployments has many new features, including:

- Update existing objects – in addition to adding new objects v2 supports updating existing objects. v2 also adds new versions to workflow maps and form templates. A must-have feature when updating an already installed vertical application
- Create multiple exports – v2 supports the creation of multiple export files. This allows different versions of exports to be created and saved without overriding previous exports. This feature is also very useful when doing migrations that are very large by allowing the data to be migrated in chunks
- Imports Selection List – in conjunction with the ability to export multiple files, v2 supports the ability to select an import file from a list of available imports. This is very useful when doing large migrations
- *Plus* – select where to export to and import from • export only the last N versions of the exported items • allow an SQL statement to be used to select the items for export • enable exporting of Signing Users and Groups • and much more

Best of Breed Migration and Testing for a Complete Livelink Solution

GCI Power Tools for Deployments can be combined with TRUcompare™ to deliver a complete solution for the design, implementation, testing, and validation of mission critical content and data migrations into Livelink.

TRUcompare, by Valiance Partners, is an automated migration-testing tool that empowers Livelink users to quickly and efficiently qualify and validate all the content and data migrated from one or more sources into a target Livelink application.

These proven and complementary products assure the most accurate and cost-effective migration results, where quality, validation, and compliance are fundamental success factors.
