» GCI Power Tools for Deployments

IT departments face challenges when rolling out new applications, or troubleshooting and integrating new modules and functionality into Livelink instances that are already in production. This process usually involves moving the application from a development environment to the testing environment and then to the production environment, or merging disparate instances into one. GCI Power Tools for Deployments solves this problem by enabling the export of an entire product object structure (or selected components) into a set of XML files and then supports moving them into the new environment together with recreating the entire structure, in the new Livelink instance. The references between all the imported objects, and the references to the system users, are all maintained.

» GCI Power Tools for Workflow

GCI Power Tools for Workflow is a collection of advanced tools for extending the functionality of Livelink workflows. These tools take basic Livelink workflow capabilities up to the next level, making it possible to enhance the user experience, extend controls over content, support auto-completion and escalation, send sophisticated email communications and also utilize a powerful event subsystem for automating responses to additions and changes to objects in a Livelink repository.

» GCI Power Tools for eSign™

The Open Text Livelink ECM-eSign module has become the Livelink workflow standard for regulated industries requiring electronic signatures that meet compliance standards such as 21 FDA CFR Part 11. GCI Power Tools for eSign enhances the capabilities of this module, adding much-needed functionality and providing a much more seamless integration with the natural business processes for companies in these highly regulated industries.

» GCI Power Tools for XML Archiving

Archiving and records management for ECM systems are an integral part of best practices and compliance for regulated industries. Archiving data from Livelink is possible with many existing solutions. However, archiving workflows and taking snapshots of Livelink items such as Projects and Workflows is not available in any existing solution -- until now. GCI Power Tools for XML Archiving addresses these needs and much more.

» GCI Power Tools for LiveReports

GCI Power Tools for LiveReports (PTLR) adds the ability to create custom displays to LiveReports. PTLR also provides the capability to run and display multiple LiveReports on a single end user report. PTLR uses industry standards such as HTML, XML, XSL, and JavaScript, so it doesn't require learning arcane tag and programming languages to create sophisticated reports.

» GCI Power Tools Migration Manager

The GCI Migration Manager is a desktop application that allows a user to select file/folder structures to import into Livelink from a file share volume. Choose the files/folders to add to Livelink, specify where to add them, select & apply group permissions to the items, define attributes and much more, all with a few mouse clicks via the intuitive user interface -- making this otherwise arduous time consuming task pain & error free. The resulting files, with their included properties, can then be imported into Livelink via GCI Power Tools for Deployments or Open Text's Object Importer.

» GCI Power Tools for PleaseReview™

GCI Power Tools for PleaseReview™ provides a seamless integration between a Livelink workflow and a PleaseReview collaborative document review. Now you can have the "best of both worlds" -- Livelink workflow can control the initiation of a PleaseReview process, impose deadlines and escalations, and capture review information as artifacts in the workflow for a complete end-to-end auditable process.
