GCI POWERTOOLS
**CONTENT
EXPORT**

Extract assets from OpenText Livelink, Content Server, or Extended ECM Platforms

Global Cents provides the tools and expertise to facilitate and automate the transport of critical information quickly and cost-effectively.

Without GCI PowerTools for Content Export, extracting Content Server or Extended ECM (xECM) assets (documents, metadata, and folder hierarchies) and making the content available for reuse in other platforms such as file systems or SharePoint, is manual, time-consuming, and error prone.

PowerTools for Content Export Key Features:

✓ Easily select the content you want and ignore the content you don't want

✓ Ability to select from all Content Server or Extended ECM (xECM) object types (e.g., documents, folders, etc.)

✓ Choose your content either through the user interface or by using specific criteria to improve your ability to identify the correct content

✓ Readily share your documents, metadata, and taxonomy with customers or partners outside of Content Server or xECM platforms

Export content and metadata, easily

PowerTools for Content Export simply and securely packages and exports content and metadata from your Content Server and xECM platforms. Your documents and metadata can then be imported into other third-party systems, including SharePoint.
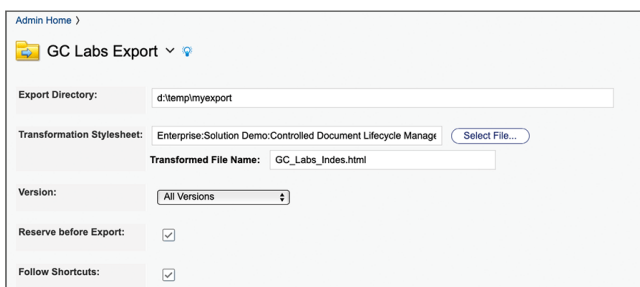

Comprehensive, yet simple to use

Easily select which documents, versions, folders, compound documents, and other Content Server or xECM objects to export. With PowerTools for Content Export, you have complete control over what is extracted, and when.

Export to XML, transform to anything

PowerTools for Content Export exports information in standard XML format. Metadata can be templated to meet the specific requirements of regulatory agencies or to enable easy transfer to other systems.

Share with anyone

Exports can be transformed into other formats, making it easy to distribute documents to external or other 3rd-party users who can view them with a browser or migrate them to SharePoint or another system.
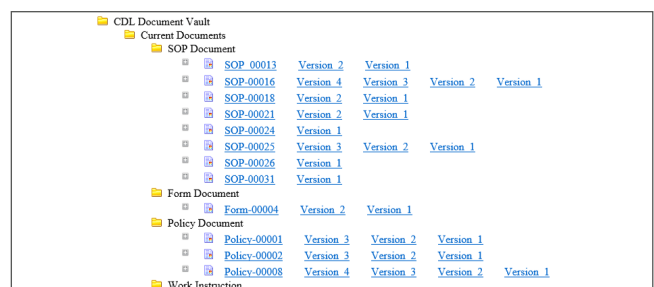

Schedule and automate exports

PowerTools for Content Export's advanced scheduling interface enables automated exports to be configured and performed in the background. Export jobs are readily defined and executed at a predetermined time or automatically on a periodic basis.

Simple visual configuration - no complex batch files

Unlike similar export tools, PowerTools for Content Export's user interface is designed for end-users. It requires no complex scripting - simply select folders and files for export, define data transformation settings and export to a specific location.
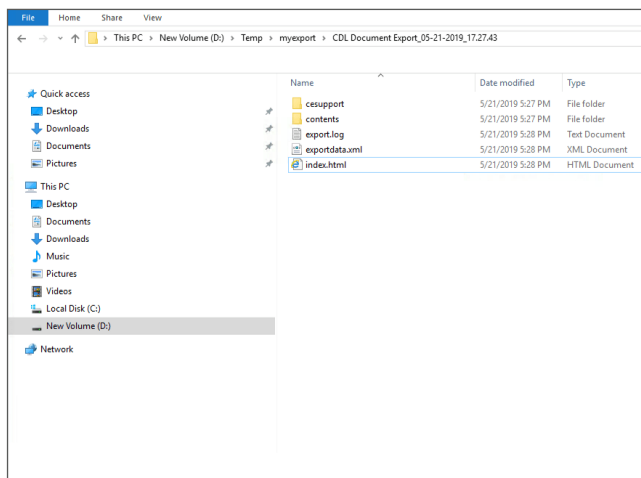

Created for regulated industries

PowerTools Content Export is the only export tool designed specifically around the needs of regulated industries. Every feature, application and tool is designed with documented compliance in mind.

Ready for transmittals

Whether used as part of a regulatory publishing process, for document transmittals, or just for storing archives of your Content Server or xECM data, PowerTools for Content Export ensures that extracted data is immediately meaningful and ready for use without further processing.
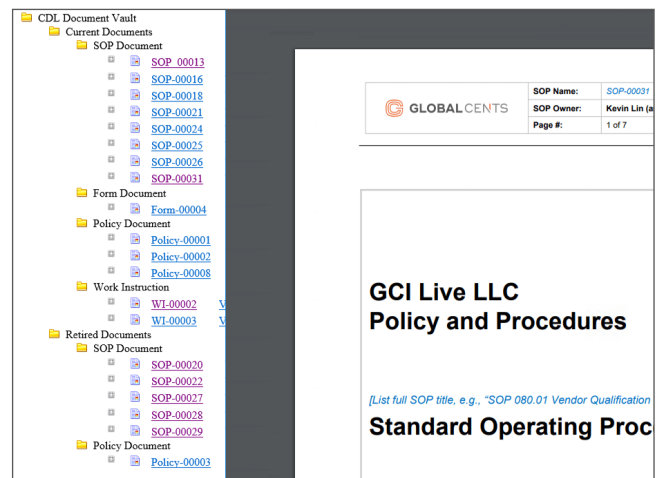

Extracting and pre-processing defined collections of documents and metadata from Content Server or xECM and making content available for distribution to clients, regulators, and other business partners can be complex.

PowerTools for Content Export offers a way to transfer content and metadata, simply and securely, from your Content Server and xECM platform into other third-party systems, including SharePoint.
